PS Disclosure; Page 133-134; 137pp; English.
XX
CC The patent discloses recombinant human gelatin which is useful
CC in various compositions including binding agents, encapsulants,
CC stabilising agents, film-forming agents, moisturising agents,
CC emulsifiers, thickening agents, gelling agents, colloidal agents,
CC adhesive agents, pharmaceutical compositions, hard gel capsules,
CC soft gel capsules, plasma expander, colloidal volume replacement
CC materials, graft coatings, medical sponges, medical plugs,
CC pharmaceutical stabilisers, micro-carriers, edible compositions,
CC protein supplements, fat substitutes, nutritional supplements,
CC edible coatings, photographic compositions, cosmetic compositions,
CC industrial composition, cell culture compositions and compositions
CC for use in the laboratory. Pharmaceutical compositions comprising
CC recombinant gelatin are used as vaccines. They are also used to
CC treat various joint conditions such as arthritis, athrosis and
CC other conditions related to the degeneration of cartilage and joint
CC flexibility. Recombinant gelatin is also used in food and beverage
CC industries. The present sequence is a recombinant human gelatin.

PT   Production of extracellular matrix proteins containing
PT   4-trans-hydroxyproline results in native self aggregating proteins,
PT   useful on medical implants -
XX
PS   Claim 16; Fig 72; 260pp; English.
XX
CC   The specification describes a method for producing an extracellular
CC   matrix protein or its fragment. The extracellular matrix protein is
CC   capable of self aggregating in a cell which does not ordinarily
CC   hydroxylated prolines. The method comprises optimising a nucleic acid
CC   sequence for expression in the cell by substitution of codons preferred
```

```
CC   by that cell for naturally occurring codons not preferred by the cell;
CC   incorporating the nucleic acid sequence into the cell; and contacting
CC   the cell with a hypertonic growth medium containing at least one amino
CC   acid, selected from the group consisting of trans-4-hydroxyproline and
CC   3-hydroxyproline to allow at least one of the amino acids to be
CC   assimilated into the cell and incorporated into the extracellular matrix
CC   protein. The method may be used to make host cells assimilate and
CC   incorporate trans-4-hydroxyproline into proteins. This is especially
CC   useful in the recombinant production of proteins such as collagen,
CC   fibrinogen and fibronectin whose ability to self aggregate and produce
CC   functional proteins depends on the post translational hydroxylation of
CC   proline. The method is also useful in studying the structure and function
CC   of polypeptides which do not normally contain trans-4-hydroxyproline.
CC   The present sequence represents a C-terminal fragment of human collagen
CC   type 1 (alpha1), with optimised codon usage, designated D4.

PS   Claim 10; Fig 80; 260pp; English.
XX
CC   The specification describes a method for producing an extracellular
CC   matrix protein or its fragment. The extracellular matrix protein is
CC   capable of self aggregating in a cell which does not ordinarily
CC   hydroxylated prolines. The method comprises optimising a nucleic acid
CC   sequence for expression in the cell by substitution of codons preferred
CC   by that cell for naturally occurring codons not preferred by the cell;
CC   incorporating the nucleic acid sequence into the cell; and contacting
CC   the cell with a hypertonic growth medium containing at least one amino
CC   acid, selected from the group consisting of trans-4-hydroxyproline and
CC   3-hydroxyproline to allow at least one of the amino acids to be
CC   assimilated into the cell and incorporated into the extracellular matrix
CC   protein. The method may be used to make host cells assimilate and
CC   incorporate trans-4-hydroxyproline into proteins. This is especially
CC   useful in the recombinant production of proteins such as collagen,
CC   fibrinogen and fibronectin whose ability to self aggregate and produce
CC   functional proteins depends on the post translational hydroxylation of
CC   proline. The method is also useful in studying the structure and function
CC   of polypeptides which do not normally contain trans-4-hydroxyproline.
CC   The present sequence represents a C-terminal fragment of human collagen
CC   type 1 (alpha2), with optimised codon usage, designated D4.

PT   Incorporating non-natural amino acid into polypeptide, useful e.g. for
PT   production of bioadhesives, by epoxidation or substitution of
PT   dehydroproline residues  -
XX
PS   Disclosure; Fig 4; 66pp; English.
XX
CC   The present sequence represents the C-terminal 219 amino acids of
CC   the human alpha1 collagen protein. Peptides derived from the protien
```

```
CC   were used to demonstrate incorporation of 3,4-dehydro-L-proline into
CC   the peptide, using the method of the invention. The specification
CC   describes a method for the incorporation of non-natural amino acid
CC   into a polypeptide. The method comprises reacting at least one
CC   3,4-dehydroproline residue in the polypeptide with an epoxidation
CC   reagent from a polypeptide containing at least one 3,4-epoxyproline
CC   residue. The method is used for studying the effects of non-natural
CC   amino acids on structure and function of polypeptides. The method is
CC   also useful for commercial production of collagen or mussel adhesive
CC   proteins (which are useful as bioadhesives), and for incorporating a
CC   wide variety of groups, including therapeutic ligands and biological
CC   probes, into polypeptides.

PT   Nucleic acids encoding 4277 human colon cancer-associated polypeptides,
PT   useful for preventing, diagnosing and/or treating colorectal cancers -
XX
PS   Claim 11; Page 7817-7819; 9803pp; English.
XX
CC   AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon
CC   cancer-associated nucleic acid molecules (N) and proteins (P), where
CC   the proteins are collectively known as colon cancer antigens. The colon
CC   cancer antigens have cytostatic activity and can be used in gene
CC   therapy and vaccine production. N and P may be used in the prevention,
CC   diagnosis and treatment of diseases associated with inappropriate P
CC   expression. For example, N and P may be used to treat disorders
CC   associated with decreased expression by rectifying mutations or deletions
CC   in a patient's genome that affect the activity of P by expressing
CC   inactive proteins or to supplement the patients own production of P.
CC   Additionally, N may be used to produce the colon cancer-associated Ps,
CC   by inserting the nucleic acids into a host cell and culturing the cell
CC   to express the proteins. N and P can be used in the prevention, diagnosis
CC   and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204
CC   and AAB77789 represent sequences used in the exemplification of the
CC   present invention.
CC   N.B. Pages 666 to 682 and page 7053 of the sequence listing were
CC   missing at time of publication, meaning no sequences are present for
CC   SEQ ID NO:1027 to 1052, 7921 and 7922.

XX
CC   The patent discloses recombinant human gelatin which is useful
CC   in various compositions including binding agents, encapsulants,
CC   stabilising agents, film-forming agents, moisturising agents,
CC   emulsifiers, thickening agents, gelling agents, colloidal agents,
CC   adhesive agents, pharmaceutical compositions, hard gel capsules,
CC   soft gel capsules, plasma expander, colloidal volume replacement
CC   materials, graft coatings, medical sponges, medical plugs,
CC   pharmaceutical stabilisers, micro-carriers, edible compositions,
CC   protein supplements, fat substitutes, nutritional supplements,
CC   edible coatings, photographic compositions, cosmetic compositions,
CC   industrial composition, cell culture compositions and compositions
CC   for use in the laboratory. Pharmaceutical compositions comprising
CC   recombinant gelatin are used as vaccines. They are also used to
CC   treat various joint conditions such as arthritis, athrosis and
CC   other conditions related to the degeneration of cartilage and joint
CC   flexibility. Recombinant gelatin is also used in food and beverage
CC   industries. The present sequence is human alpha1 (I) type I collagen
CC   helical domain (residues 531-1192). This sequence is a recombinant
CC   gelatin.

```
XX
CC   The present sequence represents a human recombinant gelatin polypeptide.
CC   The recombinant gelatin polypeptide is used to produce vaccine
CC   formulations of the invention. The recombinant human gelatin is
CC   non-immunogenic (therefore reducing anaphylactic reactions) and confers
CC   stability at ambient temperatures. The vaccine formulation comprises a
CC   vaccine formulated for the prevention of a disease selected from vaccinia
CC   virus (small pox), polio virus (Salk and Sabin), mumps, measles, rubella,
CC   diphtheria, tetanus, Varicella-Zoster (chicken pox/shingles), pertussis
CC   (whooping cough), Bacille Calmette-Geurin (BCG, tuberculosis),
CC   haemophillus influenzae meningitis, rabies, cholera, Japanese
CC   encephalitis virus, salmonella typhi, shigella, hepatitis A and B,
CC   adenovirus, yellow fever, foot and mouth disease, herpes simplex virus,
CC   respiratory syncytial virus, rotavirus, Dengue, West Nile virus, turkey
CC   herpes virus (Marek's disease), influenza and/or anthrax.

PT   useful on medical implants -
XX
PS   Disclosure; Fig 27A-E; 260pp; English.
XX
CC   The specification describes a method for producing an extracellular
CC   matrix protein or its fragment. The extracellular matrix protein is
CC   capable of self aggregating in a cell which does not ordinarily
CC   hydroxylated prolines. The method comprises optimising a nucleic acid
CC   sequence for expression in the cell by substitution of codons preferred
CC   by that cell for naturally occurring codons not preferred by the cell;
CC   incorporating the nucleic acid sequence into the cell; and contacting
CC   the cell with a hypertonic growth medium containing at least one amino
CC   acid, selected from the group consisting of trans-4-hydroxyproline and
CC   3-hydroxyproline to allow at least one of the amino acids to be
CC   assimilated into the cell and incorporated into the extracellular matrix
CC   protein. The method may be used to make host cells assimilate and
CC   incorporate trans-4-hydroxyproline into proteins. This is especially
CC   useful in the recombinant production of proteins such as collagen,
CC   fibrinogen and fibronectin whose ability to self aggregate and produce
CC   functional proteins depends on the post translational hydroxylation of
CC   proline. The method is also useful in studying the structure and function
CC   of polypeptides which do not normally contain trans-4-hydroxyproline.
CC   The present sequence represents a human collagen 1 (alpha1) protein,
CC   which may be produced using the method of the invention.

PT   Incorporating non-natural amino acid into polypeptide, useful e.g. for
PT   production of bioadhesives, by epoxidation or substitution of
PT   dehydroproline residues  -
XX
PS   Disclosure; Fig 6; 66pp; English.
XX
CC   The present sequence represents a human type 1 (alpha1) collagen protein.
CC   Peptides derived from the protien were used to demonstrate incorporation
CC   of 3,4-dehydro-L-proline into the peptide, using the method of the
CC   invention. The specification describes a method for the incorporation
CC   of non-natural amino acid into a polypeptide. The method comprises
CC   reacting at least one 3,4-dehydroproline residue in the polypeptide
CC   with an epoxidation reagent from a polypeptide containing at least
CC   one 3,4-epoxyproline residue. The method is used for studying the
CC   effects of non-natural amino acids on structure and function of
CC   polypeptides. The method is also useful for commercial production of
CC   collagen or mussel adhesive proteins (which are useful as bioadhesives),
CC   and for incorporating a wide variety of groups, including therapeutic
CC   ligands and biological probes, into polypeptides.

XX
CC   A fusion protein (AAR89472) comprises the alpha-helical region of
CC   human collagen I(a) linked to amino acids 46-93 of human mature
CC   dermatan sulphate proteoglycan (decorin).  It can be expressed in
CC   Escherichia coli transformants carrying a vector incorporating a
CC   chimeric gene (AAT16518) coding for the fusion.  The decorin binds to
CC   type I collagen and thus affects Elbril formation.  It inhibits
CC   the cell attachment-promoting activity of collagen and fibrinogen
CC   by binding to such molecules near their cell binding sites.  The
CC   collagen moiety provides an integral substratum or scaffolding for
CC   the decorin.  The fusion protein acts to reduce scarring of healing
CC   tissue.

XX
CC   The specification describes a method for producing an extracellular
CC   matrix protein or its fragment. The extracellular matrix protein is
CC   capable of self aggregating in a cell which does not ordinarily
CC   hydroxylated prolines. The method comprises optimising a nucleic acid
CC   sequence for expression in the cell by substitution of codons preferred
CC   by that cell for naturally occurring codons not preferred by the cell;
CC   incorporating the nucleic acid sequence into the cell; and contacting
CC   the cell with a hypertonic growth medium containing at least one amino
CC   acid, selected from the group consisting of trans-4-hydroxyproline and
CC   3-hydroxyproline to allow at least one of the amino acids to be
CC   assimilated into the cell and incorporated into the extracellular matrix
CC   protein. The method may be used to make host cells assimilate and
CC   incorporate trans-4-hydroxyproline into proteins. This is especially
CC   useful in the recombinant production of proteins such as collagen,
CC   fibrinogen and fibronectin whose ability to self aggregate and produce
CC   functional proteins depends on the post translational hydroxylation of
CC   proline. The method is also useful in studying the structure and function
CC   of polypeptides which do not normally contain trans-4-hydroxyproline.
CC   The present sequence represents a chimeric collagen 1 (alpha1)/decorin
CC   protein, which may be produced using the method of the invention.

CC A fusion protein (AAR89469) comprises the alpha-helical region of
CC human collagen I(a) linked to the human mature bone morphogenic
CC protein 2B (BMP2B). It can be expressed in Escherichia coli
CC transformants carrying a vector incorporating a chimeric gene
CC (AAT16515) coding for the fusion. The BMP moiety induces
CC osteogenesis, while the collagen moiety provides an integral
CC substratum or scaffolding for the BMP and cells involved in
CC reconstruction and growth. The fusion protein provides sustained
CC release and delivery of BMP to a target tissue.

PT Production of extracellular matrix proteins containing
PT 4-trans-hydroxyproline results in native self aggregating proteins,
PT useful on medical implants -
XX
PS Claim 22; Fig 13; 260pp; English.
XX
CC The specification describes a method for producing an extracellular
CC matrix protein or its fragment. The extracellular matrix protein is
CC capable of self aggregating in a cell which does not ordinarily
CC hydroxylated prolines. The method comprises optimising a nucleic acid
CC sequence for expression in the cell by substitution of codons preferred
CC by that cell for naturally occurring codons not preferred by the cell;
CC incorporating the nucleic acid sequence into the cell; and contacting
CC the cell with a hypertonic growth medium containing at least one amino
CC acid, selected from the group consisting of trans-4-hydroxyproline and
CC 3-hydroxyproline to allow at least one of the amino acids to be
CC assimilated into the cell and incorporated into the extracellular matrix
CC protein. The method may be used to make host cells assimilate and
CC incorporate trans-4-hydroxyproline into proteins. This is especially
CC useful in the recombinant production of proteins such as collagen,
CC fibrinogen and fibronectin whose ability to self aggregate and produce
CC functional proteins depends on the post translational hydroxylation of
CC proline. The method is also useful in studying the structure and function
CC of polypeptides which do not normally contain trans-4-hydroxyproline.
CC The present sequence represents a chimeric collagen 1 (alpha1)/bone
CC morphogenic protein-2B (bmp-2b) protein, which may be produced using the
CC method of the invention.

PT   Assaying collagen fragments in body fluid by immunoassay - using
PT   antibodies raised against synthetic peptide(s) contg. potential
PT   crosslinking sites, to diagnose and monitor disorders of collagen
PT   metabolism, e.g. osteoporosis.
XX
PS   Disclosure (Appendix A); Page 49; 87pp; English.
XX
CC   Determination of collagen fragments in body fluids can be achieved
CC   by immunoassay using antibodies directed against synthetic peptides
CC   derived from collagen which contain sites of potential crosslinking.
CC   The method is used to diagnose and monitor treatment of disorders of
CC   collagen metabolism (degredation of type I collagen may indicate
CC   osteoporosis, metastatic progression, Paget's disease,
CC   hyperthyroidism or other conditions involving excessive bone
CC   resorption; degredation of type II collagen may indicate rheumatoid
CC   arthritis or osteoarthritis; and of type III collagen, vaculitis
CC   syndrome). The method can also be used to assess the toxicity of a
CC   compound and to test drugs for their effect on collagen metabolism.

PT   Assaying type I collagen fragments for diagnosing osteoporosis in
PT   postmenopausal woman, involves contacting body fluid with synthetic
PT   collagen peptide and antibody and quantifying by competitive binding
PT   assay -
XX
PS   Disclosure; Column 23-37; 41pp; English.
XX
CC   The present sequence is that of human type I collagen alpha-1.
CC   The invention is based on the discovery of the presence of
CC   particular collagen fragments in body fluids of patients compared
CC   with those of healthy subjects. These fragments are generated
CC   upon collagen degradation and are partly characterised by the
CC   presence of potential sites for crosslinking. A method for
CC   assaying collagen fragments in a body fluid sample is based on the
CC   competitive binding to immunological binding partners of collagen
CC   fragments in the sample and of synthetic peptides derived from
CC   collagen and containing crosslinkable sites (see AAY96105-11). When
CC   considering the degradation of type I collagen, the assay can be
CC   used as a means of identifying excessive bone resportion, indicating
CC   the presence of osteoporosis or the metastatic progress of a
CC   malignancy. Other conditions characterized by excessive bone
CC   resportion include Paget's disease and hyperparathyroidism.

XX
CC   A fusion protein (AAR89471) comprises the alpha-helical region of
CC   human collagen I(a) linked to human dermatan sulphate proteoglycan
CC   (decorin).  It can be expressed in Escherichia coli transformants
CC   carrying a vector incorporating a chimeric gene (AAT16517) coding for
CC   the fusion.  The decorin binds to type I collagen and thus affects
CC   Elbril formation.  It inhibits the cell attachment-promoting
CC   activity of collagen and fibrinogen by binding to such molecules
CC   near their cell binding sites.  The collagen moiety provides an
CC   integral substratum or scaffolding for the decorin.  The fusion
CC   protein acts to reduce scarring of healing tissue.

```

```
XX
CC   The specification describes a method for producing an extracellular
CC   matrix protein or its fragment. The extracellular matrix protein is
CC   capable of self aggregating in a cell which does not ordinarily
CC   hydroxylated prolines. The method comprises optimising a nucleic acid
CC   sequence for expression in the cell by substitution of codons preferred
CC   by that cell for naturally occurring codons not preferred by the cell;
CC   incorporating the nucleic acid sequence into the cell; and contacting
CC   the cell with a hypertonic growth medium containing at least one amino
CC   acid, selected from the group consisting of trans-4-hydroxyproline and
CC   3-hydroxyproline to allow at least one of the amino acids to be
CC   assimilated into the cell and incorporated into the extracellular matrix
CC   protein. The method may be used to make host cells assimilate and
CC   incorporate trans-4-hydroxyproline into proteins. This is especially
CC   useful in the recombinant production of proteins such as collagen,
CC   fibrinogen and fibronectin whose ability to self aggregate and produce
CC   functional proteins depends on the post translational hydroxylation of
CC   proline. The method is also useful in studying the structure and function
CC   of polypeptides which do not normally contain trans-4-hydroxyproline.
CC   The present sequence represents a chimeric collagen 1 (alphal)/decorin
CC   protein, which may be produced using the method of the invention.

PT New recombinant nucleic acid for expressing collagen or derivatives
PT in plants - useful as, e.g. bio-materials and in therapeutic,
PT cosmetic and odontological compositions
XX
PS Disclosure; Fig 7; 138pp; French.
XX
CC The invention relates to the production of mammalian collagen in plants.
CC 2 clones: alpha3 and alpha22, spanning the human collagen type I gene
CC were isolated from a MG-63 osteosarcoma library. Clone alpha3 contained
CC 83 bp of the 5' untranslated region and the first 1920 bp of coding
CC sequence, whereas clone alpha22 contained sequence encoding amino acids
CC 171-1454 of the protein and around 500 bp of the 3' untranslated region.
CC The 2 clones were used to generate a number of fragments which were used
CC to construct composite sequences encoding variant collagen molecules.
CC The fragments are: (A) containing nucleotides (nt) -4 to 479;
CC (B) containing TAA upstream of the sequence encoding the PRS
CC (pathogenesis-related protein S) signal peptide and bases 66-77 from the
CC sequence encoding the N-terminus of the pro-collagen amino propeptide
CC domain; (C) the whole of the amino propeptide domain (nt 72-479); (D) all
CC of the amino-telopeptide domain (nt 474-534) and the N-terminus of the
CC helicoidal region (nt 535-1920); (E) the DraIII-BamHI fragment
CC (1709-2808) of alpha22, encoding aa 567-936 of the central helicoidal
CC domain; (F) the BamHI-EcoRI (2803-4362) region of alpha22, encoding
CC aa 936-1192 in the central helicoidal domain and aa 1193-1454 in the
CC C-propeptide domain; (G) the C-terminus of the C-propeptide domain
CC (aa 1346-1464) plus stop codons, and (H) as G but encoding aa 1343-1401
CC and also including the KDEL motif for retention in the ER. This sequence
CC represents a recombinant human collagen. The encoding gene was
CC constructed from fragments (A), (D), (E), (F) and (G). The recombinant
CC gene is used for expression of mammalian collagen in plant cells. The
CC transformed plants, their extracts and parts are useful as biomaterials
CC (haemostatic compresses, sponges or bandages) and in pharmaceutical,
CC medical, odontological, cosmetic and biotechnological compositions (e.g.
CC as prostheses for cardiac valves, ligaments or tendons; skin substitutes;
CC gingival implants; microcapsules for perfumes; guide tubes for nerve
CC regeneration; slow release products for antibiotics, growth factors,
CC anticancer agents or anti-inflammatories; surgical thread and components
CC of ointments). They are suitable for treating any disorder related to
CC collagen dysfunction and gelatin, produced from collagen, is used to
CC produce glues, surgical prostheses and foods.

PT Isolated polypeptides useful for treating anti-inflammatory diseases,
PT nervous system disorders, and for regenerating bone and cartilage -
XX
PS Example 4; Page 525-527; 894pp; English.
XX
CC The invention relates to polynucleotides encoding novel human
CC proteins or their active domains. The polypeptides, polynucleotides and
CC antibodies raised against the polypeptides are used in a method of
CC treatment of a mammal and prevention of disorders caused by the aberrant
CC protein expression or activity. The polypeptides can be used as
CC molecular weight markers, food supplements, and in antibody production.
CC The polypeptides are used to identify compounds which bind to the
CC polypeptides. Polynucleotides of the invention are used as probes and
CC primers, for sequencing, for chromosome or gene mapping, in the
CC production of recombinant proteins, and in generating anti-sense DNA or
CC RNA and in gene therapy. Polypeptides of the invention can be used to
CC target drugs to a tumour, in assays to determine biological activity, to
CC raise antibodies/elicit an immune response, to determine quantitative
CC protein levels, as tissue markers, and to isolate receptors or ligands.
CC Polypeptides of the invention may also be useful in treating platelet
CC disorders, stem cell disorders, regenerating bone, cartilage, tendon,
CC ligament and/or nerve tissue, wound healing, treating burns, promoting
CC the proliferation, differentiation and survival of stem cells, as a
CC contraceptive, treating osteoporosis and osteoarthritis, anaemia,
CC Alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral
CC sclerosis, stroke, immune deficiencies resulting from bacterial, viral or
CC fungal infection or from autoimmunity, cancer, allergy, asthma,
CC graft-versus-host disease, eczema, haemophilia, thrombosis,
CC anti-inflammatory diseases, nervous system disorders, and infection.
CC The present sequence represents a protein of the invention.

PT   of, and preventing collagen disorders  -
XX
PS   Disclosure; Page 21-26; 30pp; English.
XX
CC   The present sequence is that of the pro-alpha-1 chain of human
CC   type I procollagen.  The present invention relates to antisense
CC   oligonucleotides (ASOs) and their use in inhibiting expression of
CC   type I procollagen.  The ASOs comprise 18-25 nucleotides and are
CC   complementary to a specific region within the type I collagen
CC   pro-alpha-1 chain gene (see AAF90491), especially those given in
CC   AAF90492-503.  They are capable of inhibiting the expression of
CC   the pro-alpha-1 chain in a cell that expresses it.  The ASOs are
CC   used in a claimed method of treating, or reducing a risk of, a
CC   collagen disorder.  Such disorders may include those caused by
CC   overproduction of collagen fibres, such as liver cirrhosis, kidney,
CC   liver and heart fibrosis, scleroderma, hypertrophic scars and
CC   keloids.

PT   Assaying collagen fragments in body fluid by immunoassay - using
PT   antibodies raised against synthetic peptide(s) contg. potential
PT   crosslinking sites, to diagnose and monitor disorders of collagen
PT   metabolism, e.g. osteoporosis.
XX
PS   Disclosure (Appendix A); Page 53; 87pp; English.
XX
CC   Determination of collagen fragments in body fluids can be achieved
CC   by immunoassay using antibodies directed against synthetic peptides
CC   derived from collagen which contain sites of potential crosslinking.
CC   The method is used to diagnose and monitor treatment of disorders of
CC   collagen metabolism (degredation of type I collagen may indicate
CC   osteoporosis, metastatic progression, Paget's disease,
CC   hyperthyroidism or other conditions involving excessive bone
CC   resorption; degredation of type II collagen may indicate rheumatoid
CC   arthritis or osteoarthritis; and of type III collagen, vaculitis
CC   syndrome).  The method can also be used to assess the toxicity of a
CC   compound and to test drugs for their effect on collagen metabolism.

XX
PS Claim 21; Page 123; 137pp; English.
XX
CC The patent discloses recombinant human gelatin which is useful
CC in various compositions including binding agents, encapsulants,
CC stabilising agents, film-forming agents, moisturising agents,
CC emulsifiers, thickening agents, gelling agents, colloidal agents,
CC adhesive agents, pharmaceutical compositions, hard gel capsules,
CC soft gel capsules, plasma expander, colloidal volume replacement
CC materials, graft coatings, medical sponges, medical plugs,
CC pharmaceutical stabilisers, micro-carriers, edible compositions,
CC protein supplements, fat substitutes, nutritional supplements,
CC edible coatings, photographic compositions, cosmetic compositions,
CC industrial composition, cell culture compositions and compositions
CC for use in the laboratory. Pharmaceutical compositions comprising
CC recombinant gelatin are used as vaccines. They are also used to
CC treat various joint conditions such as arthritis, athrosis and
CC other conditions related to the degeneration of cartilage and joint
CC flexibility. Recombinant gelatin is also used in food and beverage
CC industries. The present sequence is human alpha1 (I) type I collagen
CC helical domain (residues 531-589). This sequence is a recombinant
CC gelatin.

XX
CC The patent discloses recombinant human gelatin which is useful
CC in various compositions including binding agents, encapsulants,
CC stabilising agents, film-forming agents, moisturising agents,
CC emulsifiers, thickening agents, gelling agents, colloidal agents,
CC adhesive agents, pharmaceutical compositions, hard gel capsules,
CC soft gel capsules, plasma expander, colloidal volume replacement
CC materials, graft coatings, medical sponges, medical plugs,
CC pharmaceutical stabilisers, micro-carriers, edible compositions,
CC protein supplements, fat substitutes, nutritional supplements,
CC edible coatings, photographic compositions, cosmetic compositions,

CC industrial composition, cell culture compositions and compositions
CC for use in the laboratory. Pharmaceutical compositions comprising
CC recombinant gelatin are used as vaccines. They are also used to
CC treat various joint conditions such as arthritis, athrosis and
CC other conditions related to the degeneration of cartilage and joint
CC flexibility. Recombinant gelatin is also used in food and beverage
CC industries. The present sequence is human alpha1 (I) type I collagen
CC helical domain (residues 531-715). This sequence is a recombinant
CC gelatin.

XX
CC   The patent discloses recombinant human gelatin which is useful
CC   in various compositions including binding agents, encapsulants,
CC   stabilising agents, film-forming agents, moisturising agents,
CC   emulsifiers, thickening agents, gelling agents, colloidal agents,
CC   adhesive agents, pharmaceutical compositions, hard gel capsules,
CC   soft gel capsules, plasma expander, colloidal volume replacement
CC   materials, graft coatings, medical sponges, medical plugs,
CC   pharmaceutical stabilisers, micro-carriers, edible compositions,
CC   protein supplements, fat substitutes, nutritional supplements,
CC   edible coatings, photographic compositions, cosmetic compositions,
CC   industrial composition, cell culture compositions and compositions
CC   for use in the laboratory. Pharmaceutical compositions comprising
CC   recombinant gelatin are used as vaccines. They are also used to
CC   treat various joint conditions such as arthritis, athrosis and
CC   other conditions related to the degeneration of cartilage and joint
CC   flexibility. Recombinant gelatin is also used in food and beverage
CC   industries. The present sequence is human alpha1 (I) type I collagen
CC   helical domain (residues 531-1192). This sequence is a recombinant
CC   gelatin.

XX
CC The specification describes a method for producing an extracellular
CC matrix protein or its fragment. The extracellular matrix protein is
CC capable of self aggregating in a cell which does not ordinarily
CC hydroxylated prolines. The method comprises optimising a nucleic acid
CC sequence for expression in the cell by substitution of codons preferred
CC by that cell for naturally occurring codons not preferred by the cell;
CC incorporating the nucleic acid sequence into the cell; and contacting
CC the cell with a hypertonic growth medium containing at least one amino
CC acid, selected from the group consisting of trans-4-hydroxyproline and
CC 3-hydroxyproline to allow at least one of the amino acids to be
CC assimilated into the cell and incorporated into the extracellular matrix
CC protein. The method may be used to make host cells assimilate and
CC incorporate trans-4-hydroxyproline into proteins. This is especially
CC useful in the recombinant production of proteins such as collagen,
CC fibrinogen and fibronectin whose ability to self aggregate and produce
CC functional proteins depends on the post translational hydroxylation of
CC proline. The method is also useful in studying the structure and function
CC of polypeptides which do not normally contain trans-4-hydroxyproline.
CC The present sequence represents a human collagen 1 (alpha1) protein,
CC which may be produced using the method of the invention.

PT   Incorporating non-natural amino acid into polypeptide, useful e.g. for
PT   production of bioadhesives, by epoxidation or substitution of
PT   dehydroproline residues -
XX
PS   Disclosure; Fig 6; 66pp; English.
XX
CC   The present sequence represents a human type 1 (alpha1) collagen protein.
CC   Peptides derived from the protien were used to demonstrate incorporation
CC   of 3,4-dehydro-L-proline into the peptide, using the method of the
CC   invention. The specification describes a method for the incorporation
CC   of non-natural amino acid into a polypeptide. The method comprises
CC   reacting at least one 3,4-dehydroproline residue in the polypeptide
CC   with an epoxidation reagent from a polypeptide containing at least
CC   one 3,4-epoxyproline residue. The method is used for studying the
CC   effects of non-natural amino acids on structure and function of
CC   polypeptides. The method is also useful for commercial production of
CC   collagen or mussel adhesive proteins (which are useful as bioadhesives),
CC   and for incorporating a wide variety of groups, including therapeutic
CC   ligands and biological probes, into polypeptides.

XX
CC   A fusion protein (AAR89472) comprises the alpha-helical region of
CC   human collagen I(a) linked to amino acids 46-93 of human mature
CC   dermatan sulphate proteoglycan (decorin).  It can be expressed in
CC   Escherichia coli transformants carrying a vector incorporating a
CC   chimeric gene (AAT16518) coding for the fusion.  The decorin binds to
CC   type I collagen and thus affects Elbril formation.  It inhibits
CC   the cell attachment-promoting activity of collagen and fibrinogen
CC   by binding to such molecules near their cell binding sites.  The
CC   collagen moiety provides an integral substratum or scaffolding for
CC   the decorin.  The fusion protein acts to reduce scarring of healing
CC   tissue.

CC   A fusion protein (AAR89469) comprises the alpha-helical region of
CC   human collagen I(a) linked to the human mature bone morphogenic
CC   protein 2B (BMP2B).  It can be expressed in Escherichia coli
CC   transformants carrying a vector incorporating a chimeric gene
CC   (AAT16515) coding for the fusion.  The BMP moiety induces
CC   osteogenesis, while the collagen moiety provides an integral
CC   substratum or scaffolding for the BMP and cells involved in
CC   reconstruction and growth.  The fusion protein provides sustained
CC   release and delivery of BMP to a target tissue.

PT   useful on medical implants -
XX
PS   Claim 22; Fig 13; 260pp; English.
XX
CC   The specification describes a method for producing an extracellular
CC   matrix protein or its fragment. The extracellular matrix protein is
CC   capable of self aggregating in a cell which does not ordinarily
CC   hydroxylated prolines. The method comprises optimising a nucleic acid
CC   sequence for expression in the cell by substitution of codons preferred
CC   by that cell for naturally occurring codons not preferred by the cell;
CC   incorporating the nucleic acid sequence into the cell; and contacting
CC   the cell with a hypertonic growth medium containing at least one amino
CC   acid, selected from the group consisting of trans-4-hydroxyproline and
CC   3-hydroxyproline to allow at least one of the amino acids to be
CC   assimilated into the cell and incorporated into the extracellular matrix
CC   protein. The method may be used to make host cells assimilate and
CC   incorporate trans-4-hydroxyproline into proteins. This is especially
CC   useful in the recombinant production of proteins such as collagen,
CC   fibrinogen and fibronectin whose ability to self aggregate and produce
CC   functional proteins depends on the post translational hydroxylation of
CC   proline. The method is also useful in studying the structure and function
CC   of polypeptides which do not normally contain trans-4-hydroxyproline.
CC   The present sequence represents a chimeric collagen 1 (alphal)/bone
CC   morphogenic protein-2B (bmp-2b) protein, which may be produced using the
CC   method of the invention.

PT   Assaying collagen fragments in body fluid by immunoassay - using
PT   antibodies raised against synthetic peptide(s) contg. potential
PT   crosslinking sites, to diagnose and monitor disorders of collagen
PT   metabolism, e.g. osteoporosis.
XX
PS   Disclosure (Appendix A); Page 49; 87pp; English.
XX
CC   Determination of collagen fragments in body fluids can be achieved
CC   by immunoassay using antibodies directed against synthetic peptides
CC   derived from collagen which contain sites of potential crosslinking.
CC   The method is used to diagnose and monitor treatment of disorders of
CC   collagen metabolism (degredation of type I collagen may indicate
CC   osteoporosis, metastatic progression, Paget's disease,
CC   hyperthyroidism or other conditions involving excessive bone
CC   resorption; degredation of type II collagen may indicate rheumatoid
CC   arthritis or osteoarthritis; and of type III collagen, vaculitis
CC   syndrome).  The method can also be used to assess the toxicity of a
CC   compound and to test drugs for their effect on collagen metabolism.

PT   Assaying type I collagen fragments for diagnosing osteoporosis in
PT   postmenopausal woman, involves contacting body fluid with synthetic
PT   collagen peptide and antibody and quantifying by competitive binding
PT   assay  -
XX
PS   Disclosure; Column 23-37; 41pp; English.
XX
CC   The present sequence is that of human type I collagen alpha-1.
CC   The invention is based on the discovery of the presence of
CC   particular collagen fragments in body fluids of patients compared
CC   with those of healthy subjects.  These fragments are generated
CC   upon collagen degradation and are partly characterised by the
CC   presence of potential sites for crosslinking.  A method for
CC   assaying collagen fragments in a body fluid sample is based on the
CC   competitive binding to immunological binding partners of collagen
CC   fragments in the sample and of synthetic peptides derived from
CC   collagen and containing crosslinkable sites (see AAY96105-11).  When
CC   considering the degradation of type I collagen, the assay can be
CC   used as a means of identifying excessive bone resportion, indicating
CC   the presence of osteoporosis or the metastatic progress of a
CC   malignancy.  Other conditions characterized by excessive bone
CC   resportion include Paget's disease and hyperparathyroidism.

XX
CC   A fusion protein (AAR89471) comprises the alpha-helical region of
CC   human collagen I(a) linked to human dermatan sulphate proteoglycan
CC   (decorin).  It can be expressed in Escherichia coli transformants
CC   carrying a vector incorporating a chimeric gene (AAT16517) coding for
CC   the fusion.  The decorin binds to type I collagen and thus affects
CC   Elbril formation.  It inhibits the cell attachment-promoting
CC   activity of collagen and fibrinogen by binding to such molecules
CC   near their cell binding sites.  The collagen moiety provides an
CC   integral substratum or scaffolding for the decorin.  The fusion
CC   protein acts to reduce scarring of healing tissue.

PT   New method for production of fibrillar collagen, useful for preparing
PT   telopeptide collagen fibrils and gelatin -
XX
PS   Example 1; Fig 3A-B; 30pp; English.
XX
CC   The invention provides a method for the production of fibrillar collagen.
CC   The method comprises: (a) culturing a recombinant host cell comprising a
CC   DNA encoding a fibrillar collagen monomer lacking a C  propeptide SSAD
CC   (sequence selection and alignment domain); and (b) producing the
CC   fibrillar collagen. The methods are used to produce fibrillar collagen,
CC   from which telopeptide collagen fibrils can be derived. Host cells,
CC   comprising DNA encoding a collagen monomer lacking SSAD or N propeptide
CC   is used to produce gelatin. Collagen is used in biological research
CC   as a substrate for in vitro cell culture and as a component of
CC   biocompatible materials for use in prosthetic implants, sustained drug
CC   release matrices, artificial skin and wound dressing and healing devices.
CC   Gelatin is particularly useful for foodstuffs and medicine, for coating
CC   tablets and making capsules. The methods, comprising the use of collagen
CC   monomers lacking the N and/or C propeptides, result in a large increase
CC   in the production of type I collagen. The present sequence represents
CC   the human preproalpha 1 (I) collagen (GenBank Accn no: AF017178).

XX
PS   Disclosure; Fig 7; 138pp; French.
XX
CC   The invention relates to the production of mammalian collagen in plants.
CC   2 clones: alpha3 and alpha22, spanning the human collagen type I gene
CC   were isolated from a MG-63 osteosarcoma library.  Clone alpha3 contained
CC   83 bp of the 5' untranslated region and the first 1920 bp of coding
CC   sequence, whereas clone alpha22 contained sequence encoding amino acids
CC   171-1454 of the protein and around 500 bp of the 3' untranslated region.
CC   The 2 clones were used to generate a number of fragments which were used
CC   to construct composite sequences encoding variant collagen molecules.
CC   The fragments are: (A) containing nucleotides (nt) -4 to 479;
CC   (B) containing TAA upstream of the sequence encoding the PRS
CC   (pathogenesis-related protein S) signal peptide and bases 66-77 from the
CC   sequence encoding the N-terminus of the pro-collagen amino propeptide
CC   domain; (C) the whole of the amino propeptide domain (nt 72-479); (D) all
CC   of the amino-telopeptide domain (nt 474-534) and the N-terminus of the
CC   helicoidal region (nt 535-1920); (E) the DraIII-BamHI fragment
CC   (1709-2808) of alpha22, encoding aa 567-936 of the central helicoidal
CC   domain; (F) the BamHI-EcoRI (2803-4362) region of alpha22, encoding
CC   aa 936-1192 in the central helicoidal domain and aa 1193-1454 in the
CC   C-propeptide domain; (G) the C-terminus of the C-propeptide domain
CC   (aa 1346-1464) plus stop codons, and (H) as G but encoding aa 1343-1401
CC   and also including the KDEL motif for retention in the ER.  This sequence
CC   represents a recombinant human collagen.  The encoding gene was
CC   constructed from fragments (A), (D), (E), (F) and (G).  The recombinant
CC   gene is used for expression of mammalian collagen in plant cells.  The
CC   transformed plants, their extracts and parts are useful as biomaterials
CC   (haemostatic compresses, sponges or bandages) and in pharmaceutical,
CC   medical, odontological, cosmetic and biotechnological compositions (e.g.
CC   as prostheses for cardiac valves, ligaments or tendons; skin substitutes;
CC   gingival implants; microcapsules for perfumes; guide tubes for nerve
CC   regeneration; slow release products for antibiotics, growth factors,
CC   anticancer agents or anti-inflammatories; surgical thread and components
CC   of ointments).  They are suitable for treating any disorder related to
CC   collagen dysfunction and gelatin, produced from collagen, is used to
CC   produce glues, surgical prostheses and foods.

PT   Isolated polypeptides useful for treating anti-inflammatory diseases,
PT   nervous system disorders, and for regenerating bone and cartilage -
XX
PS   Example 4; Page 525-527; 894pp; English.
XX
CC   The invention relates to polynucleotides encoding novel human
CC   proteins or their active domains. The polypeptides, polynucleotides and
CC   antibodies raised against the polypeptides are used in a method of
CC   treatment of a mammal and prevention of disorders caused by the aberrant
CC   protein expression or activity.  The polypeptides can be used as
CC   molecular weight markers, food supplements, and in antibody production.
CC   The polypeptides are used to identify compounds which bind to the
CC   polypeptides. Polynucleotides of the invention are used as probes and
CC   primers, for sequencing, for chromosome or gene mapping, in the
CC   production of recombinant proteins, and in generating anti-sense DNA or
CC   RNA and in gene therapy.  Polypeptides of the invention can be used to
CC   target drugs to a tumour, in assays to determine biological activity, to
CC   raise antibodies/elicit an immune response, to determine quantitative
CC   protein levels, as tissue markers, and to isolate receptors or ligands.
CC   Polypeptides of the invention may also be useful in treating platelet
CC   disorders, stem cell disorders, regenerating bone, cartilage, tendon,
CC   ligament and/or nerve tissue, wound healing, treating burns, promoting
CC   the proliferation, differentiation and survival of stem cells, as a
CC   contraceptive, treating osteoporosis and osteoarthritis, anaemia,
CC   Alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral
CC   sclerosis, stroke, immune deficiencies resulting from bacterial, viral or
CC   fungal infection or from autoimmunity, cancer, allergy, asthma,
CC   graft-versus-host disease, eczema, haemophilia, thrombosis,
CC   anti-inflammatory diseases, nervous system disorders, and infection.
CC   The present sequence represents a protein of the invention.

PT   Novel antisense DNA oligonucleotide useful for inhibiting the
PT   expression of wild type COL1A1 gene, for treating, reducing the risk
PT   of, and preventing collagen disorders  -
XX
PS   Disclosure; Page 21-26; 30pp; English.
XX
CC   The present sequence is that of the pro-alpha-1 chain of human
CC   type I procollagen.  The present invention relates to antisense
CC   oligonucleotides (ASOs) and their use in inhibiting expression of
CC   type I procollagen.  The ASOs comprise 18-25 nucleotides and are
CC   complementary to a specific region within the type I collagen
CC   pro-alpha-1 chain gene (see AAF90491), especially those given in
CC   AAF90492-503.  They are capable of inhibiting the expression of
CC   the pro-alpha-1 chain in a cell that expresses it.  The ASOs are
CC   used in a claimed method of treating, or reducing a risk of, a
CC   collagen disorder.  Such disorders may include those caused by
CC   overproduction of collagen fibres, such as liver cirrhosis, kidney,
CC   liver and heart fibrosis, scleroderma, hypertrophic scars and
CC   keloids.

```

```
XX
CC   The specification describes a method for producing an extracellular
CC   matrix protein or its fragment. The extracellular matrix protein is
CC   capable of self aggregating in a cell which does not ordinarily
CC   hydroxylated prolines. The method comprises optimising a nucleic acid
CC   sequence for expression in the cell by substitution of codons preferred
CC   by that cell for naturally occurring codons not preferred by the cell;
CC   incorporating the nucleic acid sequence into the cell; and contacting
CC   the cell with a hypertonic growth medium containing at least one amino
CC   acid, selected from the group consisting of trans-4-hydroxyproline and
CC   3-hydroxyproline to allow at least one of the amino acids to be
CC   assimilated into the cell and incorporated into the extracellular matrix
CC   protein. The method may be used to make host cells assimilate and
CC   incorporate trans-4-hydroxyproline into proteins. This is especially
CC   useful in the recombinant production of proteins such as collagen,
CC   fibrinogen and fibronectin whose ability to self aggregate and produce
CC   functional proteins depends on the post translational hydroxylation of
CC   proline. The method is also useful in studying the structure and function
CC   of polypeptides which do not normally contain trans-4-hydroxyproline.
CC   The present sequence represents a chimeric collagen 1 (alphal)/decorin
CC   protein, which may be produced using the method of the invention.

PT   New tabular silver halide emulsion, useful for production of
PT   components for photographic products
XX
PS   Claim 9; Fig 10; 30pp; English.
XX
CC   This is the amino acid sequence of recombinant mouse type I
CC   collagen COL1A1-2, obtained by expression of COL1A1-2 cDNA from
CC   vector pCOL1A1-2 in transformed Pichia pastoris GS115 host cells.
CC   The invention relates to a new tabular silver halide emulsion
CC   comprising silver halide grains nucleated in the presence of a
CC   nucleation peptizer and grown in the presence of a growth peptizer,
CC   at least one of the peptizers being a pure collagen-like material,
CC   such as the present protein, prepared by genetic engineering of a
CC   native collagen-encoding nucleic acid.  Also claimed is production
CC   of the recombinant collagen-like polypeptide comprising expression
CC   of a collagen-like polypeptide nucleic acid sequence by a
CC   microorganism selected from Hansenula, Trichoderma, Aspergillus and
CC   preferably P. pastoris, the collagen-like polypeptide being obtained
CC   at a level greater than 0.95 g/l (especially over 3 g/l) and free of
CC   helix structure.  The emulsion is suitable for photographic
CC   application.  Recombinant DNA technology enables the efficient
CC   production of large amounts of substantially pure collagen material,
CC   providing a high level of expression without requiring expensive
CC   media, expression hosts or non-secreting expression hosts.  The
CC   collagen can be selected and/or adapted for optimal use in each
CC   particular stage of the production process of the photographic
CC   product.  Removal of collagen MGPR motifs that are recognised by a
CC   P. pastoris protease will also increase expression levels.
